

Will my solar power system cost less than my utility bill?

Many customers see lower monthly cost right away for their solar power system, compared to their utility bill. For almost any customer, a solar power system can lower their total power expense over the life of the system.

If you consume 700 kilowatt hour of electricity or more per month, a solar system can provide lower energy costs for you.

Electricity rates have increased significantly. Over the last 25 years, electricity rates for homeowners in California have risen by more than 5% a year, on average, year after year.

This increase in electricity rates is expected to continue as costs for fuel increase and as California utilities ponder expensive options to increase electricity production.
